

Part Three: Soccer League

Design a schema for a simple sports league. Your schema should keep track of

- All of the teams in the league
- All of the goals scored by every player for each game
- All of the players in the league and their corresponding teams
- All of the referees who have been part of each game
- All of the matches played between teams
- All of the start and end dates for season that a league has
- The standings/rankings of each team in the league (This doesn't have to be its own table if the data can be captured somehow).
